

Overview

Duct-filter units

Duct pre-filter units KPF are designed to clean the air in air-conditioning and ventilating systems. Built-in filters are of G3 to F9 class.

Duct HEPA filter unit AKF is being used in the network of inlet and outlet ducts used to supply or extract air from the rooms with highest demands regarding air cleanness.

HEPA filter units

Wall HEPA filter units (AFH) and ceiling HEPA filter units (AFV-8, AFV-8B, AFV-8C) are used in both, supply and exhaust air ventilation and air-conditioning installations, which require maximal cleanness of the air. Built-in HEPA filters are of E10 to H14 class.

Ceiling HEPA filter units types AFV-8G and AFV-8C have a special washer frame for attachment the filter via gel gasket. Versions guarantee absolute sit tightness for the filters up to class U16.

Operating theatre ceiling with HEPA filters

Supply ceilings with built-in HEPA filters of E10 to H14 class, are used for clean rooms where air cleanness as well as intensive air-exchange is required. They are constructed to be built in false ceilings of operation rooms, intensive care premises and other clean rooms.

Fluff separator and filter grilles

Fluff separators LN and Filter grilles FR are applied in air exhaust from clean rooms. They are designed for wall mounting.

Legend of symbols

- Al Element is made of aluminium profiles, aluminium sheet or aluminium casting.
- St Element is made of steel sheet.
- Element is powder painted in standard RAL 9010 colour. Other desired colour is to be specified in the order.
- Element is intended to be built in the wall.

- Element is intended to be built in the ceiling or in the wall.
- Element for air conditioning of rooms with floor to ceiling heights room up to 4 m.
- Element allows regulation by electric motor (Belimo electric motors).
- Element is intended for air filtration.
 The filter of class ... is built in.

- Element is intended for air filtration. Filter is not included.
- The possibility of the automatic selection and calculation of the technical characteristics of grilles and difusers in regard to the given conditions with the assistance of the Klima ADE program.
- The element is made of stainless sheet steel AISI 304.

Duct filter units

Duct pre-filter units KPF

Application

Duct pre-filter units KPF are built in supply air installations before rooms, which demand higher air cleanness. KPF units extend the service life of HEPA filters, because larger dirty particles are removed by pre-filters, which are built in the system before HEPA filters.

Description

KPF unit comprises filter of B x H x L dimensions, filter frames and bag filters of G3 to F9 class. Filter housing is made of sheet metal, air-tight welded according to DIN 1946 and coloured in RAL 9010. Housing is fitted with connections for measuring of pressure drop. Galvanized steel sheet KPF possible (not airtight).

Installation

Basic frames are being fitted into the KPF units via the side opening. The procedure requires 1000 mm of free space (Fig. 1). KPF housing is fitted into the duct network via the self-locking flange.

Accessories

See chapter Accessories.

Technical data

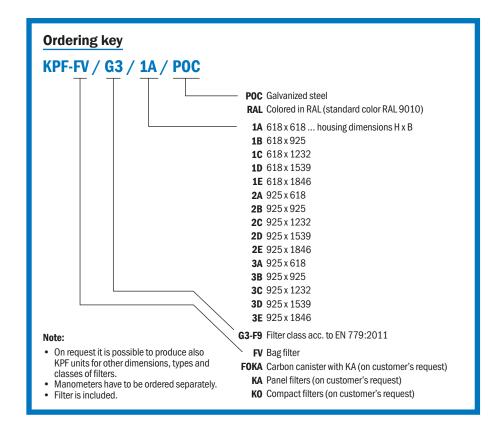

See chapter Filter, subchapter Bag filters.

Filter lifetime

Filter pollution is controlled by means of a differential manometer. The connections for plastic tubes are already fitted on the duct pre-filter units KPF.

Fig. 2: Possible filter elements combinations

Duct HEPA filter units AKF

Application

Duct HEPA filter unit AKF is being used in the network of inlet and outlet ducts used to supply or extract air from the rooms with highest demands regarding air cleanness. They can be installed as follows:

- · air supply and extract in laboratories,
- air supply and extract in operation rooms, infection- and sterile departments
- air supply in electronics, precision mechanics, chemistry, pharmaceutics and food industry,
- air supply in film and audio tape industry,
- air supply and extract in nuclear technology etc.

Description

AKF unit is made of filter housing, connection flanges and HEPA filter. Filter is fitted with washer of a rectangular cross-section. Filter housing is made of sheet metal airtight welded according to DIN 1946 and coloured in RAL 9010. Two pressure gauge attachments for measuring of a pressure drop are incorporated into the housing.

Bag-in, bag-out design (Safe filter replacement with the use of bags)

"Bag-in, bag-out" design is intended for filtration of air from the processes during which hazardous or toxic substances are produced. The bag-in-out system prevents any contact with the contents of a waste filter when replacing it. The installation of a pre-filter prolongs the life of a HEPA filter. The system of pre-filter replacement is the same as HEPA filter replacement.

Installation and design variations

AKF housing are designed for installation of single AKF-I filter units. (fig. 1, fig. 2) as well as installation of several AKF-II units (fig. 3, fig. 4) into the duct system. To replace the filter, 700 mm of free space is required on the front side of the unit. AKF-II unit is made in several design variations, determined by the position of connection flanges A1, A2, B1, B2 (fig. 5, fig. 6).

AKF-II (connection flange dimensions)

AKF-II (position of flange connections)

Fig. 6

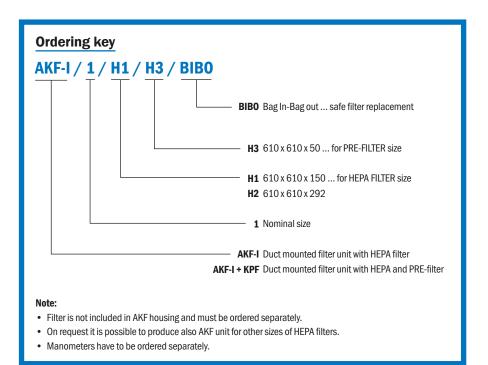

Expected service life of HEPA filter and replacement

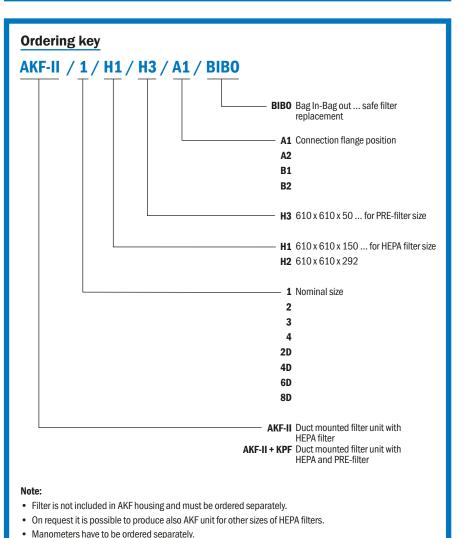

HEPA filter are constructed for single use only. Expected service life of filter depends on air flow volume, pressure drop and amount of dust particles. When air flow volume is reduced for 25 %, expected service life of HEPA filter doubles. Service life can be considerably increased with installation of pre-filter.

HEPA filter pollution is controlled by means of a differential manometer which can be fitted on the housing. Connections for plastic tubes are fitted on AKF housing.

When the pressure drop has reached double its initial value, it is recommended to replace the HEPA filter. When replacing the AKF filter, remove cover, release the lever and finally remove the frame with used HEPA filter. When installing the new filter, use the above instructions in opposite order.

In case of replacement of filters using bags (bag-in, bag-out system), the procedure is the same with the exception of a bag attached to the extension. The waste filter is removed into a bag, which has been attached to the extension since the last replacement. The bag is then hermetically closed so that after the separation of the part of the bag with the filter, a part of the bag remains on the extension. hermetically closed as well. A new filter is put in a bag and then placed over the remaining part closing the duct. Upon the placement of the new bag, the remaining part of the old bag is first removed into the new bag. A new filter is installed from the new bag. The bags are attached to the extension by means of a rubber collar.

Ceiling and wall HEPA filter units

■ Wall HEPA filter units AFH-1

Application

Wall HEPA filter unit AFH-1 is being used in the network of inlet and outlet ducts used to supply or extract air from the rooms with highest demands regarding air cleanness. HEPA filter is fitted with a washer of a rectangular cross section. With the AFH-1/3 version, the seal may also be semi-circular. They can be installed as

- air supply and extract in laboratories,
- air supply and extract in operating rooms, infection- and sterile departments,
- · air supply in electronics, precision mechanics, chemistry, pharmaceutics and food industry,
- air supply in film and audio tape industry,
- air supply and extract in nuclear technology etc.

Description

AFH-1 unit is made of filter housing, two-row steel grille JR-5 and HEPA filter. Filter housing made of sheet steel is air tight welded according to DIN 1946 and coloured in RAL 9010. Grille is made of cold-drawn strip steel and coloured in RAL 9010. Grille is fastened to the housing via the nuts which can be tightened or unscrewed manually. AFH-1 unit is fitted with special sealing frame for sit-tightness test.

Design variations

The type of sealing frame determines three filter unit types and two HEPA filter sizes (AFH-1/1 and AFH-1/3, size 1 and 2).

Installation

AFH-1 unit is designed for installation in the walls of the clean rooms.

Accessories

See chapter Accessories.

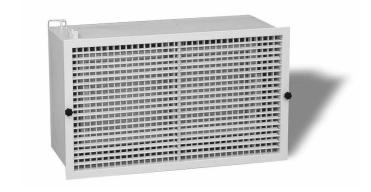

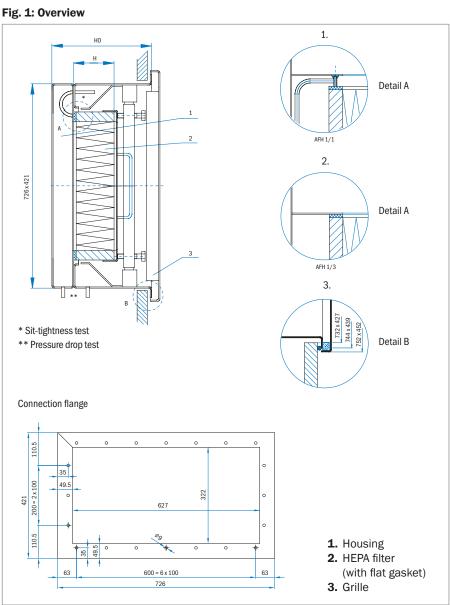

Table 1: Overview

St

HEPA filter unit	Application	Class
AFH - 1/1	Sit-tightness and SCAN test	E12, H13, H14
AFH - 1/3	SCAN test	E10, E11

Technical data

Size of grille regarding the size of housing and HEPA filter is specified in table 2. Technical data for the JR-5 grille are stated in the catalogue.

Size and flow characteristics of HEPA filters installed in AFH-1 are specified in chapter Filters.

Expected service life of HEPA filter and replacement

HEPA filters are constructed for single use only. Expected service life of filter depends on air flow volume, pressure drop and amount of dust particles. When air flow volume is reduced for 25 %, expected service life of HEPA filter doubles. Service life can be considerably increased with installation of pre-filter.

Absolute filter pollution can be controlled by means of a differential manometer which can be fitted on the housing.

Connections for plastic tubes are fitted on AFH-1 housings.

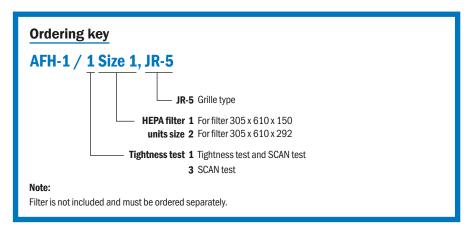

When the pressure drop has reached double its initial value, it is recommended to replace the HEPA filter. When replacing the AFH-1 filter, remove grille and screws on the holding bar and then remove the bar together with used filter. When installing the new filter use the above instructions in opposite order. The sit tightness is to be tested according to DIN 1946, chapter 4. The permeability at the test pressure of 2000 Pa should not exceed the values stated in standard.

The checking is carried out with sit-tightness measuring device.

Table 2: Technical data

Nom		HEPA filter	но	H1	Grile JR-5	weight AFH-1/1 *	weight AFH-1/3 *
1		305 x 610 x 150	338	150	725 x 425	23,7 kg	21,7 kg
2	2	305 x 610 x292	480	292	725 x 425	27,6 kg	25,5 kg

Note: Deviation of weight is ± 10 %.

Ceiling HEPA filter units with flat gasket AFV-8

Application

Ceiling HEPA filter units AFV-8 are used in supply or extract air applications in air conditioning and ventilating installations of the rooms with highest demands regarding air cleanness. They can be installed as follows:

- · Air supply and extract in laboratories,
- Air supply and extract in operating rooms, infection- and sterile departments,
- Air supply in electronics, precision mechanics, chemistry, pharmaceutics and food industry,
- · Air supply in film and audio tape industry,
- · Air supply and extract in nuclear technology etc.

Description

Ceiling HEPA filter unit AFV-8 is made of filter housing, standard diffusers KD-1, AKD-1, KD-6, OD-8 or OD-9 and HEPA filter. Filter is fitted with washer of a rectangular cross-section. Housing of sheet steel is air tight welded according to DIN 1946 and coloured in RAL 9010. Two pressure gauge attachments for measuring of a pressure drop are incorporated into the housing. Diffusers made of sheet steel are coloured in white (RAL 9010). AFV-8 housing has a special sealing frame designed to perform sit tightness test.

Installation

AFV-8 unit is constructed to fit into suspended ceilings.

Types

The following HEPA filter units AFV-8 are possible:

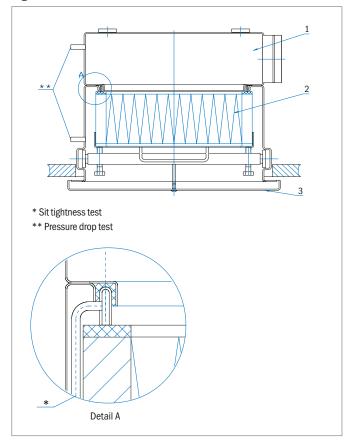

- With circular side entry spigot (AFV-8 RS) (fig. 2, table 1).
- With circular top entry spigot (AFV-8 RV) (fig. 3, table 2).
- With rectangular side entry spigot (AFV-8 KS) (fig. 4, table 3).

Accessories

See chapter Accessories.

^{*}Outer dimension of diffuser front plate.

AFV-8 with shut-off damper ZL-2

Application

On the ceiling HEPA filter unit AFV-8 a shut-off damper ZL-2 is installed in the housing connection. The shut-off damper ZL-2 conforms to the EN 1751 class 4 standard requirements.

The advantage of such a combination of an HEPA filter housing and a shut-off damper is the ability to close the shut-off damper during the filter exchange and thereby to prevent room air pollution. Upon the completion of the filter exchange, the shut-off damper is reopened. Such a filter exchange procedure eliminates the need to disinfect the room, which is mandatory in the case of exchanging the filter without shutting-off the inlet of non-filtered air.

Description

On the connection of the standard ceiling HEPA filter unit AFV-8, a galvanised sheet steel shut-off damper is mounted by means of four screws. The damper may be controlled either manually or by means of an electric motor.

Fig. 5

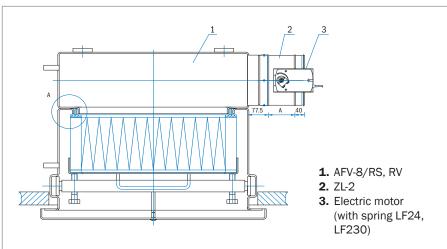

Table 5: Dimensions of AFV-8 with shut-off damper ZL-2

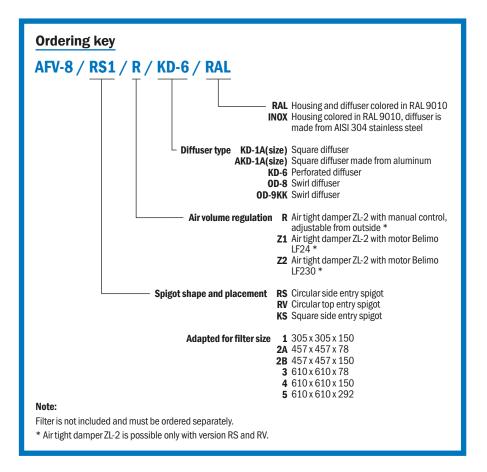

AFV-8			ZL-2			
Size	HEPA filter	φD	size	Α		
1	305 x 305 x 150	148	150	100		
2A	457 x 457 x 78	198	200	130		
2B	457 x 457 x 150	198	200	130		
3	610 x 610 x 78	198	200	130		
4	610 x 610 x 150	298	300	130		
5	610 x 610 x 292	348	350	130		

Expected service life of HEPA filter and replacement:

HEPA filter are constructed for single use only. Expected service life of filter depends on air flow volume, pressure drop and amount of dust particles. When air flow volume is reduced for 25 %, expected service life of HEPA filter doubles. Service life can be considerably increased with installation of pre-filter. The dirtiness of the filter is controlled by the means of differential manometer. Connections for plastic tubes are fitted on AKF housing.

The initial pressure drop is specified in Filter chapter. When the pressure drop has reached double its initial value, it is recommended to replace the HEPA filter. When replacing the AFV-8 filter, remove diffuser and screws on the holding bar and then remove the bar together with used filter. When installing the new filter use the above instructions in opposite order. The sit tightness is to be tested according to DIN 1946 standard, chapter 4. The permeability at the test pressure of 2000 Pa should not exceed the values stated in standard. The checking is carried out with sit-tightness measuring device.

Ceiling HEPA filter units with semicircular or U-shaped gasket AFV-8B

Description

- General description: air supply for highest standards of air purity,
- Filter: E10...H14 class (EN 1822:2009),
- Front plate: KD-1A, KD-6, OD-5, OD-9, OD-15, SR-4,
- Dry gasket: (PO) semicircular or (U) U-shaped profile,
- Suitable for: air supply in laboratories, infection and sterile departments, electronics, precision mechanics, pharmaceutics, chemistry, food, film and audio tape industry.

Material and surface protection

- Filter housing, diffuser and spigot connection housing is made from cold rolled steel,
- Holding brackets are made from stainless steel,
- Filter holders are made from galvanized engineering steel.

On costumer's request any other material can be chosen.

Filter housing and front plate are powder coated in RAL 9010. On costumer's request any other color in RAL can be chosen.

Accessories

See chapter Accessories.

Note:

- Total weight = weight of front plate + weight of housing + weight of filter.
- Deviation of weight is ±10 %.

Detail: Filter gasket type

(U) U-shaped profile:

- It is considered as dry gasket
- Filter tightness test (DIN 1946-4): YES
- Measuring tube size Φ4 mm on housing allows pressure tapping for filter tightness test (position 8)

(PO) Semicircular shaped profile:

- · It is considered as dry gasket
- Filter tightness test (DIN 1946-4): NO
- Housing doesn't have measuring tube for pressure tapping for filter tightness test

Detail: Filter and front plate fixing

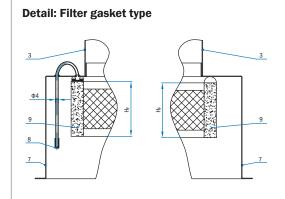

Bottom plate is mounted with screws to movable nuts (position 10) on filter housing. Filter is fixed in place with pressure screw on filter holders (position 11 and 17). Height of filter can be from 69 up to 78 mm.

Detail: UPSTREAM connection for scan test

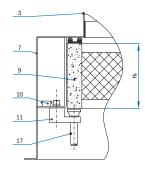

Housing has UPSTREAM connection (position 6) size $\Phi 8$ mm for scan test. This way you can tapper concentration of MPPS size aerosol on dirty side of filter and confirm filter efficiency and also filter housing tightness.

It can also be used to monitor static pressure before filter + Δp .

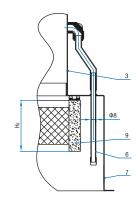

Fig. 1

- 9. Filter
- 10. Bottom plate nuts
- **11.** Filter holders

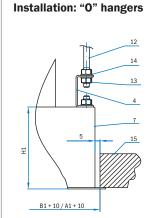

Installation: "O" hangers

When using "0" hangers, first step is to mount four threaded rods size 8 mm (position 12) to fixed ceiling according to dimension a and b from Table 1 in place of AFV-8B final position. Second step is to make B1+10 / A1+10 size hole in suspended ceiling to fit filter housing (position 7). Final step is to place sealant on interface of filter housing and suspended ceiling and secure it in place with nut (position 13) and spring washer (position 14) on to threaded rod.

Installation: "T" traverse

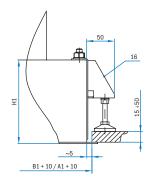

When using "T" traverse, first step is to is to make B1+10 / A1+10 size hole in suspended ceiling to fit filter housing (position 7). Then place sealant on interface of filter housing and suspended ceiling, attach traverse (position 16) on filter housing and secure it to the suspended ceiling. Thickness of suspended ceiling can be from 15 to 50 mm).

Regulation:

First you need to install filter and lock it into place. Then you have to loose screw for hatch blocker (position 5) and move regulation hatch (position 1) into place with regulation axis (position 3). Then you have to tighten screw for hatch blocker (position 5) and install bottom plate.

Housing size:

Standard air volume regulation can be chosen only for filter size F10, F20, F30, F40, F50.

Material and surface protection:

- filter housing, bottom plate and spigot connection housing is made from cold rolled steel.
- holding brackets and regulation axis are made from stainless steel,
- detachable regulation hatch is made from galvanized sheet steel,
- filter holders are made from galvanized engineering steel.

On costumer's request any other material can be chosen.

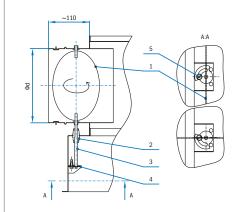

Filter housing and bottom plate are powder coated in RAL 9010, 30 % gloss. On costumer's request any other color in RAL can be chosen.

Dimensions and weight 1,2

Ceiling HEPA filter unit with semicircular or gel gasket AFV-8C

Description

- General description: air supply for highest standards of air purity
- Filter: HEPA H14 class (EN 1822:2010)
- Front plate: swirl diffuser OD-5
- Fluid gasket: (G) gel
- Dry gasket: (P0) semicircular shaped profile
- Suitable for: air supply in laboratories, infection and sterile departments, electronics, precision mechanics, pharmaceutics, chemistry, food, film and audio tape industry

HEPA filter – information

- · Manufacturer: CamfilFARR
- Size: 508 x 508 x 86
- Filter class: H14 class (EN 1822:2009)
- Air flow / initial pressure: 700 m³/h / 168 Pa
- · Recommended end pressure: 450 Pa
- Efficiency: ≥ 99,995 % MPPS
- Gasket: gel liquid seal (G) or semicircular expanded polyurethane (PO)
- Frame: extruded anodized aluminum profile
- · Grid: painted steel grids on both sides
- · Media: glass fiber paper

With every filter, list of IMPORTANT ADVICES is given by manufacturer. Safety and installation instructions must be read before handling!

HEPA filter - handling:

Filter must be transported and stored in vertical position as it is shown on picture (detail: filter packing). Filter shall be stored in a clean and dry place with air temperature from +5 °C up to +40 °C.

Ceiling HEPA filter units with gel gasket AFV-8G

Application

Ceiling HEPA filter unit with gel gasket AFV-8G are installed in ventilating and air conditioning systems in rooms which require absolutely clean air. They can be used for both, air supply and extract applications.

Applications

- · Air supply and extract in laboratories,
- Air supply and extract in operating theatres, infection- and sterile departments,
- Air supply in electronics, precision mechanics, chemistry, pharmaceutics and food industry,
- · Air supply in film and audio tape industry,
- · Air supply and extract in nuclear technology etc.

Description

Ceiling HEPA filter unit with gel gasket AFV-8G is made filter housing, standard diffusers KD-1, AKD-1, KD-6, OD-8 or OD-9 and HEPA filter. Housing of sheet steel is air tight welded according to DIN 1946 and coloured in RAL 7001. Diffusers are made of sheet steel and coloured in white (RAL 9010). AFV-8G housing has a special sealing frame designed to fit "gasket" filters.

Advantage of gel gasket:

With liquid sealant force, necessary to hold the filter is smaller, compared with neoprene washers, permitting lighter and cheaper housing and faster filter replacement.

Installation

AFV-8G unit is constructed to fit into suspended ceilings.

Types

The following ceiling HEPA filter units with gel gasket are possible:

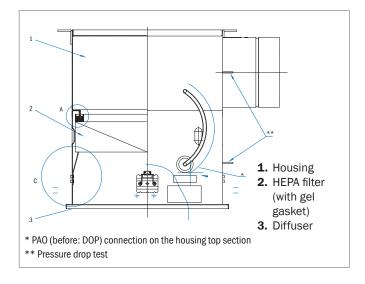

- With circular side entry spigot (AFV-8G/RS) (fig. 2, table 1),
- With circular top entry spigot (AFV-8G/RV) (fig. 3, table 2),
- With rectangular side entry spigot (AFV-8G/KS) (fig. 4, table 3).

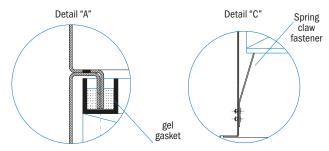

Accessories

See chapter Accessories.

AFV-8G with shut-off damper ZL-2

Application

On the Ceiling HEPA filter units with gel gasket AFV-8G a shut-off damper ZL-2 is installed in the housing connection. The shut-off damper ZL-2 conforms to the EN 1751 class 4 standard requirements.

The advantage of such a combination of an HEPA filter housing and a shut-off damper is the ability to close the shut-off damper during the filter exchange and thereby to prevent room air pollution. Upon the completion of the filter exchange, the shut-off damper is reopened. Such a filter exchange procedure eliminates the need to disinfect the room, which is mandatory in the case of exchanging the filter without shutting-off the inlet of non-filtered air.

Description

On the connection of the standard AFV-8G unit, a galvanised sheet steel shut-off damper is mounted by means of four screws. The damper may be controlled either manually or by means of an electric motor.

Expected service life of HEPA filter and replacement

HEPA filter are constructed for single use only. Expected service life of filter depends on air flow volume, pressure drop and amount of dust particles. When air flow volume is reduced for 25 %, expected service life of HEPA filter doubles. Service life can be considerably increased with installation of pre-filter. The dirtiness of the filter is controled by the means of differential manometer. Connections for plastic tubes are fitted on AFV-8G housings.

The initial pressure drop is specified in Filter chapter. When the pressure drop has reached double its initial value, it is recommended to replace the HEPA filter. When replacing the AFV-8G filter, remove diffuser and press the springs to unlock filter and finally remove the filter (fig. 1, detail C). When installing the new filter press the filter frame until mounting springs lock at the bottom of the filter frame.

Ceiling diffuser with pre-filter APF

Application

It is designed for the installation in rooms withspecial requirements (computer centres, libraries, and archives).

Description

Swirl diffuser with the pre-filter consists of thefilter housing and the 20 mm diameter filtercartridge, which is installed into the housing. Filter cartridge must be replaced, when the pressure drop increases. Filter is available inquality range G3 to M5.

Material and surface protection

Diffuser and diffuser mouting frame are made of cold roled steel and coloured in RAL 9010. Plenum box is made of galvanized sheet steel.

Filter replacement

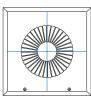

When replacing the filter, first release the locksand lower the diffuser into vertical position. Drawout the congested filter insert and replace it with a new one of the same quality. Return the diffuserinto its original position and fasten it with thelocks.

Installation

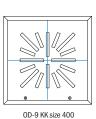

The diffuser is designed for the installation inraster ceiling structures with 600 x 600 partitions.

Operating theatre ceilings

Operating theatre ceiling – perforated version DPS

Application

DPS with absolute filter is being used in clean rooms which require clean air but also frequent air-exchange within the working area. They are designed to be built-into the false ceilings of OP rooms and intensive care premises and to ensure the laminar flow of the absolute clean air into the target zone. The aim of the above device is to reduce the possibility of infection in OP rooms being caused by germs which are due to different causes constantly present in the premises and surroundings. DPS is suitable for OP rooms class lb by DIN 1946-4.

Description

The preparation of air for the OP theatre is accomplished with separate air conditioning system, capable of rough and fine air-filtering according to DIN 24185. The filtered supply air is distributed to the absolute filter on the DPS plenum box. The air is discharged from the pressure chamber into the OP theatre via the perforated ceiling plates. The temperature of the discharged air is to be 1° to 3 °C lower then the average room temperature. Two thirds of the air current should be led out of the room via the floor and one third via the ceiling. The air current which is being discharged from the DPS flows over the entire area under the ceiling thus preventing the surrounding air from penetrating within the operation area (fig. 1).

Base material of pressure chambers and perforated plates

Steel sheet painted with epoxy dusty paint RAL 9010, resistant to disinfectants.

Some ceilings are composed of two parts, which are bolt together at the assembly point. In the assembly operations the connections are additionally packed with the acrylic putty, which is attached to the ceiling.

At the consumer's request the ceiling contains a transition for the operating light of the dimensions 300×300 mm. In that case a blind plate and a plate with a round opening of $\Phi150$ mm.

Perforated plates (from inside the ceiling) are covered with white G4 filter for a more uniform distribution of air. The delivered foam is packed in a foil in order to protect it from dirt and damage.

Fixation of the perforated plates is on the one hand carried out with the help of hinges and on the other hand with the help of locks.

The ceiling is fitted with the HEPA filters $610 \times 305 \times 292$, which belong to the class H13 or H14 and have been tested according to the EN1822:2010 . They are fitted into the side connection on the longer side of the ceiling. The dimensions of the connection duct and the number of filters are given in the table. The inside of the ceiling is fitted with the filter pressure drop measurement connections (the difference between the pressure in front of and behind the filter, which serves to control the dirtiness of the filter) and with the SCAN test connection.

The initial pressure drop is given in Filter chapter. At a filter load with larger or smaller flow rates than the nominal the pressure drop increases and decreases respectively, which is shown in the diagram. Leak-tightness of HEPA filter at the sealing frame is in accordance with the DIN 1946 standard, Chapter 4. When changing filters one has to check the leak-tightness of the hinges.

The ceiling, filter body, filters, white G4 filter and the assembly material are delivered separately.

The assembly of ceilings to the concrete ceiling is carried out with the threaded bars and inners for the concrete.

HEPA filter replacement

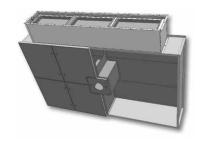

During the operation the permeability of the HEPA filter is decreased and the differential pressure increases. The permeability-loss rate is measured with differential manometer via the tubes fitted in front and after the filter. When the pressure drop has reached double its initial value, it is recommended to replace the HEPA filter. When replacing absolute filters, the first row of face plates has to be removed.

Accessories

See chapter Accessories.

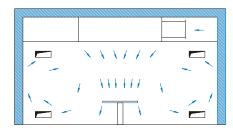

With transition for the light and three filters

Operating theatre ceiling – textile version DSS

DSS ventilation ceiling with polyester textile is used to air condition hospitals where intensive air exchange is required, in cleanrooms classified under US Fed Std 209 E and DIN 1946/4 standards. It is intended to be built into a suspended ceiling in operating rooms and intensive care facilities. DSS is suitable for OP rooms class Ib by DIN 1946-4.

Description

The basis of the ceiling is a standard DPS perforated ventilation ceiling whose panels are replaced with synthetic textile affixed to aluminum or stainless steel frames. The ceiling and filter housing may be either stainless steel or painted zinc-plated panels.

The synthetic textile allows laminar flow, because the tight weave of the fibers prevents turbulent flow from forming on the surface. The polyester textile adheres to DIN 4799 standards for the hygienic minimum for operating rooms. It has also all the necessary certificates for use in operating rooms, and it has high resistance to aggressive disinfectants. The synthetic textile may be single-layer or double-layer. The second layer allows the air to be evenly distributed across the entire surface before it enters the room.

Ceilings are made of one, two or four parts, depending on size. All elements are screwed together at the installation site. Joints are additionally sealed with acrylic lute.

At the customer's request, the ceiling might be worked out with a transition for an operation lamp with dimensions of 300×300 mm. In this case a plate with a round opening for the lamp is attached.

Fastening of the synthetic mask is done by special screws that are fixed manually, without special tools.

They are built in the connections from the side or from the top. Dimensions of the connecting channels and the number of filters are given in the table. Connection is possible from the side or from the top, depending on the customer's requirements. Inside the ceiling, connectors are built for measuring the pressure drop on filters (the difference between the pressure before and after the filter, indicating how dirty the filter is), as well as a connection for SCAN test.

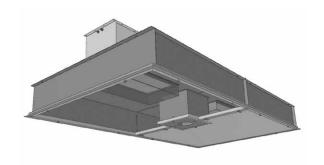

When filters are loaded with flow volumes greater or lower than nominal, the pressure drop increases or decreases as shown on the diagram.

After each filter change, a scan test must be performed in accordance with standards.

Accessories

See chapter Accessories.

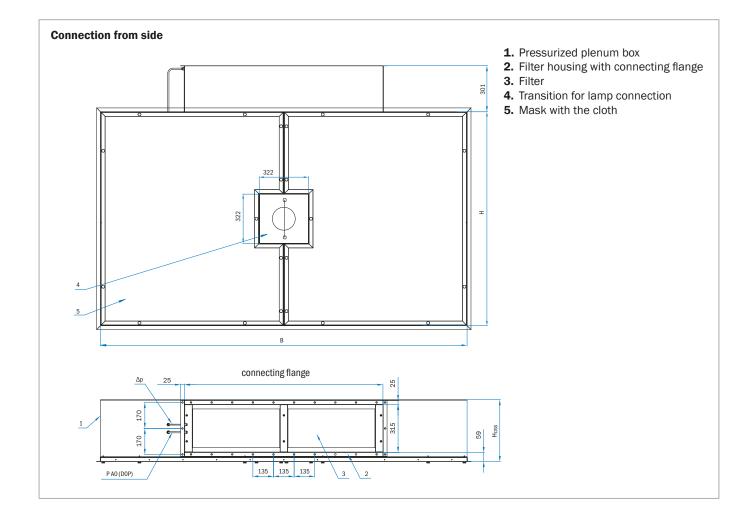

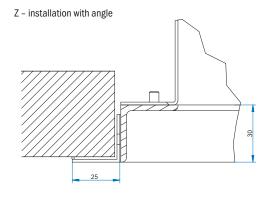

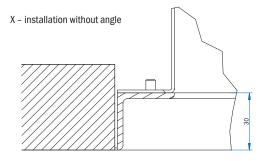

Table 1: Technical data

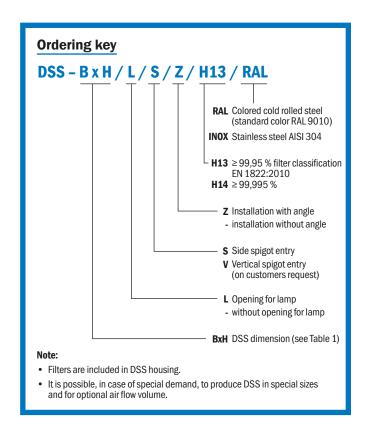

В	н	H _{DSS}	Q [m³/h]	Weight [kg]	No. of filters [/]	Connection lange

3000	3000	435	7200	272	8	four connections 1302 x 315	

At two or more connections, distance between connections is a minimum of 200 mm.

Installation

Fluff separator

■ Fluff separator LN-1

Application

The fluff separator is an air exhaust grille designed for wall mounting in rooms with special air purity demands (operation theatres, computer centres, ...). It is primarily used for air exhaust.

The grilles are made of stainless (grinding) sheet steel. The grille face consists of a frame with a closely woven stainless mesh welded on.

The installation frame can accommodate either a filter (LN-1/filter) or an air flow rate adjustment stainless steel insert F (LN-1/F). (To adjust the insert, remove the grille face.) Front plate is fastened on the installation frame with the stainless steel screw.

Installation

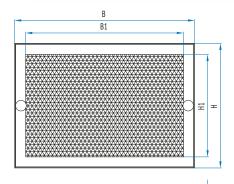

The grille may be mounted flush with the wall face.

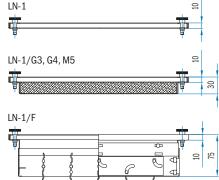

Filter Insert Cleaning and Replacement:

Due to dirt, which collects on the grille, it needs to be removed and cleaned from time to time. Due to the build-up of impurities, the grille must be removed and cleaned. Loosen the grille face screw and simply withdraw the grille face from the installation frame. With the LN-1/filter variant, withdraw the filter insert from the frame and replace it by a new insert.

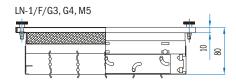

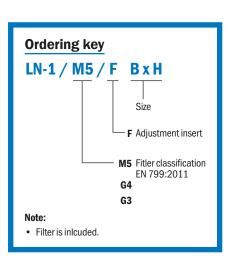

Table 1: Dimensions and weight

Note: Deviation of weight is ± 10 %.

■ Fluff Separator LN-2

Application

The fluff separator is an air exhaust grille designed for wall mounting in rooms with special air purity demands (operation theatres, computer centres, ...).

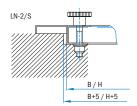

It is primarily used for air exhaust.

Description

The grilles are made of stainless (grinding) sheet steel. The grille face consists of a frame with a closely woven stainless mesh welded on.

The installation frame can accommodate either a filter (LN-2/filter) or an air flow rate adjustment stainless steel insert F (LN-2/F). (To adjust the insert, remove the grille face). Front plate is fastened on the installation frame with the stainless steel screw.

Installation

Filter Insert Cleaning and Replacement:

Due to the build-up of impurities, the grille must be removed and cleaned. Loosen the grille face screw and simply withdraw the grille face from the installation frame.

With the LN-2/filter variant, withdraw the filter insert from the frame and replace it by a new insert.

Filter grille

Filter grille FR

Application

Grilles with a filter are intended to be built in the walls of rooms which require cleaner air (computer centres, libraries, clean rooms, etc.). Primarily used for exhaust air from the room.

Description

Grilles are made of stainless (polish) sheet metal. The installed filter is of G3, G4 or of M5 quality.

Dimensions

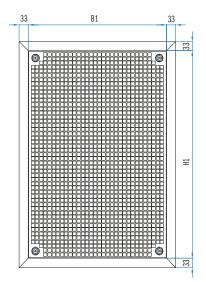

Standard dimensions of louvres are 225 x 225 mm to 625 x 625. The depth of the grilles is 35 mm.

Installation

Grilles may be fixed with visible screws (V marking, screws on the grille frame) or hidden into the installation frame (marking 2, grille is fastened on the installation frame with the lock on the internal side of the grille. Installation frame shall be fixed on the wall before the installation of the grille.)

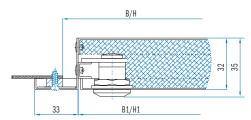

Filter replacement

Due to the dirtiness of a filter, the pressure drop on a louvre gradually increases, therefore it is necessary to replace the filter. The replacement of a filter is quick and simple. Lock may be used to open the grille and replace dirty filter with the new one. The mask is then closed by means of a lock.

Installation:

1. by screws (designation V)

2. onto the installation frame (designation 2)

Picture 6: Filter drawing H-H_/PO/MDF/AAF/F_

Dry gasket, semicircular profile

filter version: FilHF ... high flow
manufacturer: American Air Filter
frame material: POC galvanized steel

• temperature limit: 70 °C

• recommended final pressure: 750 Pa

• suitable for: AKF

Table 10: Filter technical data H-H_/PO/POC/AAF/F_
